

Assignment-1

10 types of websites (Definition, features, exclusive features, example of each type of websites)

Md. Anhar Hossain Khan

Batch no. IB-SQA-05

Overview of Worldwide Domain Name Registrations

The total number of registered website domains worldwide continues to grow rapidly, reflecting the expansion of the internet and digital services. Recent estimates indicate that there are approximately 364.3 million registered domain names globally, with .com domains dominating the market at around 161 million registrations, accounting for nearly 42% of all domains. When combined with .net, the total exceeds 174.2 million registrations, highlighting the strong presence of these generic top-level domains. These domains support a wide range of web applications, including commercial businesses, eCommerce platforms, educational institutions, government services, and non-profit organizations. The global domain name system is regulated and maintained by organizations such as ICANN, which ensures proper domain allocation and overall internet stability. As more individuals and businesses establish an online presence, the number of active domains continues to increase steadily each year.
